

Karmayogi Institute of Technology (Poly), Shelve

Department Of Computer Technology

Micro-Project Proposal

Name of Subject: Programming With Python

Subject Code: -22616

Guided by:

Mrs .Ramgude.R.P.

Presented By:

TYCM304 Lokare Sujata Sharad

TYCM310 Gajare Dipali Bhaskar

TYCM335 Pawar Amruta Aravind

TYCM336 Kawade Sanika Pandurang

TYCM337 Bagal Shreya Siddhanath

During Academic Year 2024-25

Project Title : " Various Methods or Functions In Python"

Projects Details:

Block diagram (s):

Theory of Micro-Project Topic :

- **del:** This is a keyword in Python used to delete elements from a list or dictionary by index or key.
- **clear():** This method is used to remove all elements from a list.
- **remove():** This method removes the first occurrence of a specified value from a list.
- **pop():** This method removes the element at the specified position (index) from the list and returns it.
- **append():** This method adds an element to the end of the list.
- **insert():** This method inserts an element at the specified position (index) in the list.
- **extend():** This method adds all the elements of an iterable (such as a list) to the end of the list.
- **min():** This function returns the smallest element in a list.
- **max():** This function returns the largest element in a list.
- **len():** This function returns the number of elements in an object (such as a list, tuple, or set).
- **add():** This method adds an element to a set. If the element is already present, it doesn't add it again.
- **reverse():** This method reverses the elements of a list in place.
- **sort():** This method sorts the elements of a list in ascending order. It can take parameters to customize sorting behavior.

Time required for completing the project and deadline.

We will require 1 week to collect information and complete this project.

Requirements:

- Operating Systems. Windows 7, 8, 10 or 11
- Processor & Memory
- Transmission media and connector
- A set of computers with NIC card installed in it.

Idea of project:

Although python is easy to learn, it can sometimes present difficulties, especially if you are learning the complex aspects of the language.

For example, you can find motivation in the fact that you're likely to get a promotion in your current role or get your dream job once you acquire advanced Python skills.

Conclusion:

Extended classes and methods in Python provide a powerful way to create flexible and modular code. By understanding and using inheritance effectively, you can streamline your programming tasks and make your code more organized and maintainable
